An environmental economic consulting firm is hired to measure the production schedule for a coal-burning electric generating plant in such a way as to incorporate the negative externalities associated with the pollution from the plant. The marginal social cost of this plant's production can be expressed as  $MSC = 3Q$ . Prior to the consulting firm's report, the consultants asked the plant's manager for data to generate the firm's supply schedule. The consultants calculate that the marginal private cost of the plant's production can be expressed as  $MPC = Q$ . The firm's demand curve can be expressed as  $P = 60 - 2Q$ . If the consultants have accurately measured the impact of the pollution externality, the firm is \_\_\_\_\_ by \_\_\_\_\_ dollars.

3. Suppose in a market with  $Q^d = 200 - 10P$  and  $Q^s = 10P$  the government imposes a price floor of \$15. If the government is required to purchase any surplus at the price floor, how much will the government have to pay to purchase the surplus in this market?
4. Suppose that a particular plant emits a chemical that pollutes the ground water. Without considering the effects of the pollution, the firm has a marginal private cost curve of  $MPC = 2Q + 30$ . The firm faces a demand curve of  $P = 60 - Q$ . If the firm were to incorporate the costs of the pollution, the firm would have a marginal social cost curve of  $MSC = 4Q + 30$ . What is the value of an optimal emissions fee that would achieve the socially optimal level of output?
